Little Tree, Phuket Little Tree, also known as Little Tree Garden and Little Tree Pond, is one of the 16 villages of Bang Rak (บางรัก) and the location of a river reserve (Bang Rak River Reserve). It is located in the northwest of Phuket Island, Thailand. Geography Little Tree is composed of 9 sub-districts or mueangs: Little Tree Bang Rak Bang Rak Pin Bang Rak Noi Chang Khwae Khuet Khuet Khlong Kam Bang Rak Noi Waem History In 1989, the Bang Rak Forest Reserve was established to protect the ecosystem of the area, including trees and animals. The name of the reserve comes from the trees that grow in its area. They are named little tree because they are small and frequently get damaged by the typhoon. Little Tree is not only to protect the forest, but it is also a place to recreate. People go there to swim, play sports and relax. In the Little Tree community, they hold a festival in November each year in honor of the Bang Rak River. Facilities Little Tree is known for its swimming and water sports. The Bang Rak River is a popular destination for swimming and kayaking. The river has numerous dips, cliffs, and is home to many interesting birds, like kingfishers,

I tried below code it work fine for English country but does not work for some of the other language. It would be great if you can suggest me how to make it work for all the language. string country = "eng"; string language = "en"; string languageCode = "en-US"; //string countryCode = "us"; //string languageCode = "en-US"; string isoCountry = new System.Globalization.CultureInfo(country).TextInfo.OriginalName; string isoLanguage = new System.Globalization.CultureInfo(language).TextInfo.Name; string isoLanguageCode = new System.Globalization.CultureInfo(isoLanguage).TextInfo.Name; string isoCountryCode = new System.Globalization.CultureInfo(countryCode).TextInfo.Name; Console.WriteLine(isoCountry); Console.WriteLine(isoLanguage); Console.WriteLine(isoLanguageCode); Console.WriteLine(isoCountryCode); A: for all country code use below code, string langCode = "en-US"; A: If you want to develop the application locally, I'd recommend using the ISO 639-1 code. This works for more than just the English language, but for any supported language. My tests show that the API uses this language code when selecting the languages. For example: german US-BG -> german-US german DE -> de-AT german US-PA -> us-en More examples: eng-US -> English (US) de-DE -> Deutsch eng-US -> English de-DE -> Deutsch Generally, the only other code that will work f678ea9f9e
