Google Chrome Extensions Now Available on Windows, Mac OS X, Linux. NET has a download certificate; it is easier to find and use. I was wondering if there is any knowledge base or online instructions.Q: How to store data from the other activity in the activity we are in? I have a situation where I am already in one activity and I need to store some data there. I then need to display that data in another activity. How can I store the data in the other activity? A: For that you need to use this: Look for those lines: savePreference(String key, String value); loadPreference(String key, String def); As you can see these lines are used to save/load some data from SharedPreferences. If you have some more code, please let me know. This is how you can save

data: SharedPreferences sharedPreferences = getSharedPreferences("MyPrefs", MODE_PRIVATE); SharedPreferences.Editor editor = sharedPreferences.edit(); editor.putString("my_key", "some_value"); editor.commit(); And this is how you load data: String value = sharedPreferences.getString("my_key", "default_value"); Hope this helps you. Q: Google authentication with Python I want to authenticate with google with python. I googled and read a lot about it. I downloaded the google authentication library, but didn't manage to find an example that works. I will only need to authenticate the users. So how should I do that? This is what I have so far: import urllib2 from hmac import new as hmac import base64 import hashlib auth = "my_key" secret = "my_secret" login_url = "" fields = urllib.urlencode({'scope': '82157476af
